

This guide will show you how to configure Java to use Http-Tunnel. Reasons for doing so vary. One reason is that Java is blocked to you but the web site you navigate to is not. By configuring Java you can save resources and time by tunneling Java and not the entire browser.

Once you have Http-Tunnel installed, run the application, The main window will appear, choose the configure option. There you will be presented with three (3) options.

1. You can Select Auto detect if you want Http-Tunnel to detect your settings.
2. No Proxy, only a firewall if this is appropriate.
3. Specify Proxy, Here you will enter the IP address and Port number of the proxy that you use.

Complete 1 of the 3 options, then click test, the client will bind to port 1080 and localhost by default and connect to the tunnel servers if your settings are correct.

Go to Control panel and Open Java. The Java control panel should appear. ' Click ' on the Proxies tab. Uncheck ' Use Browser Settings ' . Next, ' Click ' on Socks to highlight the Socks field. Once you have done that then ' Click ' the area to the right under Address. That widow then becomes active, enter the value: 127.0.0.1. Next ' Click ' the area to the right under Port. That window becomes active. Then fill in the value :1080 . ' Click ' Apply and then exit.
